

# House prices prediction

## Real Estate Agency

### Introduction

For this challenge, a housing price dataset is provided in the .csv file format. The primary focus is not on model performance. Instead, the aim is to evaluate how a business problem is translated into a valid machine learning (ML) use case. This involves performing exploratory data analysis (EDA), implementing the solution, and structuring all its components effectively. A working model is expected at the end of the challenge, along with an evaluation of its performance.

### Task

Any preferred tools can be used, but the final results should be presented as a one-pager. This one-pager should include a description, all relevant code, and generated results or visualizations.
